

Assignment 2: Responsive Landing Page

Overview

Design and build a multi-section landing page (for a fictional product, app, or service of your choosing). The page uses CSS Grid to lay out its overall sections and Flexbox for the content inside each section, and is designed and built mobile-first.

Learning Objectives

- Use CSS Grid to structure a page into multiple sections
- Use Flexbox to lay out the content within an individual section
- Apply mobile-first responsive design principles
- Use at least one media query to adapt the layout as the viewport grows

Requirements

- Several distinct sections on one page: for example hero, features, footer, and more
- CSS Grid used for the overall section/page layout
- Flexbox used for the content inside each section (e.g. a row of cards, a nav bar, a button group)
- Designed and built mobile-first: base styles target small screens first
- At least one media query breakpoint that adapts the layout for larger screens
- A consistent design system: a limited color palette and a defined spacing scale used throughout
- No horizontal scrolling or broken/overlapping layout at any width between 320px and 1440px

Technical Specifications

- Organize CSS logically (e.g. base styles, then section/component styles, then media queries)
- Use relative units (% , rem, fr) where appropriate rather than fixed pixel widths for layout

Submission Guidelines

- Submit a GitHub repository link and a zipped project folder
- Include at least two screenshots in your submission showing the page at a mobile width and a desktop width

Grading Rubric

Criterion	Points	Description
Responsive behavior	25	Layout adapts cleanly across the mobile-first breakpoint(s) with no overflow or breakage
Grid section layout	15	CSS Grid is used purposefully to lay out the page's overall sections
Flexbox content layout	15	Flexbox is used purposefully for the content within at least one section
Visual design & consistency	20	Cohesive color palette, typography, and spacing system across all sections
Code organization	15	CSS is logically structured and written mobile-first
Content completeness	10	Several sections present (e.g. hero, features, footer, and more) and well-populated
Total	100	

Note: Submissions that do not run, fail to load, or throw uncaught errors on open may receive a substantial deduction across all criteria, since graders cannot evaluate functionality that isn't demonstrable.
